

Settje Agri-Services & Engineering, Inc.

Since 1997, Settje Agri-Services has designed, engineered, permitted or constructed hundreds of livestock facilities. We work with growers, producers, farmers and integrators to provide livestock production systems that maximize efficiency, profitability, long-term value and return on investment.

Our company offers unrivaled experience in the planning, design, engineering, construction and environmental compliance requirements of beef, swine, poultry and dairy facilities.

Modern production facilities are complex systems that require detailed planning and specifications. We take a consultative, technical approach with our customers, and are focused on ensuring that every project culminates in a facility that meets their requirements and exceeds their expectations.

Whether it's a 2,400 head hog confinement barn or a 20,000 head cattle feedlot, our approach involves an attention to detail at every step: site selection, design, engineering and construction - all phases will be managed and verified to meet the agreed upon specifications and quality standards.
