The vulnerability of groundwater contamination was determined using soil properties and depth to groundwater as indicated on pesticide labels. Even though the water table is greater than 30 feet below the surface, the soils are porous and caution should be used.

- **Sand, loamy sand and sandy loam soils with little organic matter and a water table greater than 30 feet below the surface.** These areas have a moderate vulnerability to groundwater contamination. Even though the water table is greater than 30 feet below the surface, the soils are porous and caution should be used.

- **Sand, loamy sand and sandy loam soils with little organic matter and a water table generally greater than 30 feet below the surface.** Much of this area has a moderate vulnerability to groundwater contamination because the soils are porous. Some parts have silty and loamy soils and slight vulnerability to groundwater contamination. Caution should be used in sandy areas.

- **Generally silty and loamy soils with a water table less than 30 feet below the surface.** Much of this area has a moderate vulnerability to groundwater contamination because the water table is less than 30 feet below the surface. Some parts have sand, loamy sand or sandy loam soils with little organic matter and high vulnerability to groundwater contamination. Extreme caution should be used in sandy areas. Caution should be used throughout the entire area.

- **Silty and loamy soils with a water table generally greater than 30 feet below the surface.** Much of this area has a slight vulnerability to groundwater contamination.

- **Generally silty and loamy soils with a water table greater than 30 feet below the surface.** These areas have a slight vulnerability to groundwater contamination.

- **Generally silty and loamy soils with a water table greater than 30 feet below the surface.** Much of this area has a slight vulnerability to groundwater contamination. Some parts have sand, loamy sand or sandy loam soils with little organic matter and moderate vulnerability to groundwater contamination. Caution should be used in sandy areas.

- **Silty and loamy soils with a water table greater than 30 feet below the surface.** These areas have a slight vulnerability to groundwater contamination.
